Keylogger with Encrypted Logging

Introduction

A keylogger is a tool used to record keystrokes typed by a user. This project demonstrates how keystroke logging works in a controlled and ethical environment for educational purposes.

Abstract

This project is a Python-based keylogger that captures user keystrokes and stores them securely. The logged data is encrypted before saving to ensure confidentiality. It helps in understanding how monitoring tools work and highlights the importance of system security.

Tools Used

- Python
- pynput library
- cryptography library

Steps Involved

1. Capture keystrokes using the pynput library.
2. Store the keystrokes temporarily in memory.
3. Encrypt the data using a secure encryption algorithm.
4. Save the encrypted logs into a file.
5. Optionally, simulate sending logs to a secure server.

Conclusion

This project provides insight into how keyloggers function and emphasizes ethical use. It also demonstrates how encryption can protect sensitive logged data from misuse.
